

AMENDMENTS TO THE SPECIFICATION

Please replace the paragraph starting at page 7, line 4 and ending at page 7, line 15 with the following paragraph:

In accordance with this aspect of the present invention, a user may login to a Web site
5 or mail server quickly and easily without having to re-enter a user name and password
at each subsequent visit. As noted above, the central database may store a specific
user name and password associated with each and every account maintained by the
user; when the user wishes to access a particular account at a specific Web site or mail
server, the present invention allows the user to invoke program scripts at the central
10 server which automate the login procedure. The central server navigates to the proper
page or site, identifies the login form, accesses the appropriate user name and
password information from the database, completes the form with the proper user data
extracted from the database using a fuzzy fill procedure, and submits the form on behalf
of the user automatically, thus logging the user into the account at the site. As noted
15 above, such automation may be particularly desirable in the case where a user is
operating a terminal having a limited-function keypad or cumbersome navigation tools.
